

Vacuumping To Waste

You can use:

Power Floc - (Liquid that will not interfere with your Ph or TA)

Or

Aluminum Sulfate (Will bottom out Ph & TA)

Fill pool as full a possible.

Mix ____ lbs Alum in water (mix each 1 lb in 5 gal of water) and spread over top of pool.

Or use Power Floc according to bottle _____ oz.

Filter or Re-circulate for 1 hour, then turn the pool off.

Everyone stay out of pool. Let water get real still. Wait till all settles to pool floor. See clear water and white / green cloud at pool floor. May take 24 to 48 hrs.

Hook up manual vac (no automatic pool cleaners) and vac the pool on "waste" or "drain". You will loose a lot of water. Let water run into pool as vacuuming and you may have to stop a couple of times if you loose suction.

After vac all stuff from floor on waste - re fill the pool and run overnight and bring in another water sample to re check phosphate levels.

May have to do it a second time.
